TDT 4186
Practical Exercise 2e

Exploit:
If the user knows exactly the location and name of a file in the system, they can type it in the URL and access the file.
This can be dangerous if the webserver uses a webroot that also contains other files such as documents or system files.

Fix 1:
Block all incoming requests for files not in a list of allowed files.

Fix 2:
Encrypt all closed files with a passcode only authorized users know.
